Q- Commerce.

In Q- commerce I am selecting a product ×yz. let's call it xyz. The primary aim of selecting this product is that it is spicy and tasty. Some different from others same product and also some add it more. also focusing on a single product like will same time If we select many products it would take longer time and may cause trust issue for the customer, especially when it comes to delivery time.

Another issue with

Platforms like foodpanda is
that they often take longer for
deliveries. However with pizza the
benefit is that ~~they often~~
we can prepare the product
in any house and send it directly
the delivery boy. this way
we not only ensure the
product is fresh but also
contool the delivery process.

Additionally when a
customer buys the product, the
request will go to the nearest
location which prepare it

If the nearest delivery location accepts the request, the product will be sent from there, reducing the time and ensuring timely delivery. This approach helps solve the problem of long delivery times which currently take an hours. like foodpanda taking two and three hours to receive the delievery to customer.

.X. who is your target audience .X.

target audience:. the target audience mostly officed & placed where people or bussiness bussiness man always busy in

worked. next ④ target audience

Students placed where Stadient mostly lived without families but bussiness family Student.

young Adults place :- young man also want to spicy things.
              that my all aim to Solve problem of marketplace

       product Services :- Pizza
